QUESTION(S): Did you like working with Rust and why? Which parts felt straightforward to you and why? Which parts did you have issues with and why? What is your overall impression of Rust as a language?

From my perspective the parts of rust that felt straight forward was declaring variable and setting functions. I had a major issue with getting rust installed and setup with my mac. I could not get any of my programs to run with a cargo file. This may be because I used it in IntelliJ rather than a dedicated ide. Instead, I practiced in Programmiz. Overall, I feel that once I get my installation situated I will be using in the future to further my programming catalogue.

QUESTION(S): Which GUI framework did you use and why? Was working in this language easy or hard and why?

Due to already having a good amount of swiftui based apps, I decided to go with it. This language was pretty straight forward due to already knowing javafx and tkinter from previous courses and this course.
